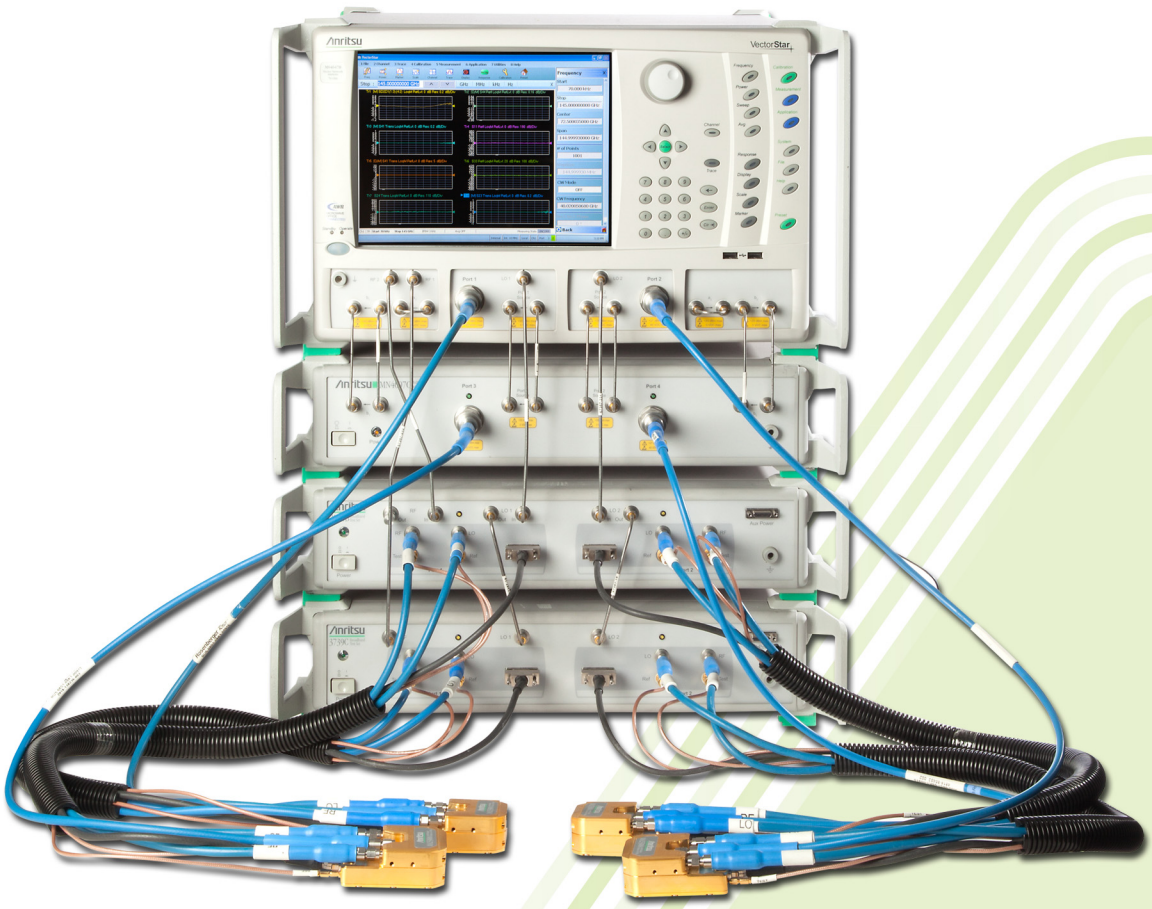
Broadband VNA System	70 kHz to 220 GHz
mmWave Waveguide VNA System	50 GHz to 1.1 THz



Introduction

Through the use of a novel coaxial-mode interface connector and advanced transceivers, broadband frequency coverage beyond 220 GHz is now possible. The ME7838G4 allows a continuous, broadband frequency sweep, in a four-port setup, from 70 kHz to 220 GHz without the need to concatenate multiple systems (operational from 40 kHz to 226 GHz). The result is more accurate device characterization from near-DC through the G band frequencies. W band devices can now be characterized well through the second harmonic of the operating frequency of the application for more accurate modeling and higher success rate from the first design turn. Integrating Anritsu's unique strength in nonlinear transmission line technology (NLTL), the ME7838G4 system offers many advances in broadband performance over traditional systems including:

- Industry-best broadband frequency coverage, starts at 70 kHz instead of 10 MHz and is operational from 40 kHz to 226 GHz through a single coaxial-mode connector
- Industry-best dynamic range, 112 dB at 67 GHz, 108 dB at 110 GHz, 100 dB at 140 GHz, and 102 dB at 220 GHz
- Industry-best measurement speed, 310 ms for 401 points at 10 kHz IFBW
- Compact, lightweight mmWave modules for easy, precise, and economical positioning on the wafer probe station, 0.6 lb and 1/50 the volume of traditional mmWave modules
- The first millimeter wave system with real-time leveling of power without the need for calibration software correction tables
- Industry-best calibration and measurement stability, 0.1 dB over 24 hrs
- Fully supports tri-axial Kelvin bias tee connections for on-wafer device biasing up to 220 (226) GHz
- mmWave waveguide coverage to 1.1 THz
- The ME7838A4X 125 GHz and ME7838D4 145 GHz Broadband systems can be easily upgraded to 220 GHz by incorporating the new Anritsu MA25400A mmWave module

System and Receiver Dynamic Range, Noise Floor (Referenced to the coaxial mode flange interface on the MA25400A module)

System Dynamic Range	System dynamic range is measured as the difference between maximum port power and the RMS noise floor in a 10 Hz bandwidth and no averaging (ports terminated).
Noise Floor	Noise floor is calculated as the difference between maximum rated port power and system dynamic range.
Receiver Dynamic Range	Receiver Dynamic Range is calculated as the difference between the receiver compression level and the noise floor at the appropriate port.
Normalizing Measurement	Normalizing measurement made with a through line connection, with its effects compensated for. The cables between the VNA and the MA25400A modules are assumed to be among those offered by Anritsu. All values are typical.

Measurement Uncertainties – SOLT/SSST

The graphs give measurement uncertainties after the above calibration at a port power of -18 dBm. The component uncertainties are combined based on their characteristics: residual directivity, load and source match, tracking, network analyzer dynamic accuracy and connector repeatability are assumed to be fully correlated while noise effects (high level noise and noise floor effects) are assumed to be internally uncorrelated and uncorrelated with the first group of terms. 10 Hz IF Bandwidth is used. For transmission uncertainties, it is assumed that $S_{11} = S_{22} = 0$. For reflection uncertainties, it is assumed that $S_{21} = S_{12} = 0$. Specifications for Waveguide Band Configuration

ME7838G4 mmWave VNA, Waveguide Bands

Three configurations are available for waveguide band operation above 145 GHz when using the ME7838G4 system.

- First, the MA25400A Broadband mmWave module can be adapted to waveguide measurements using an available WR5 adapter. Lower band coaxial-to-waveguide adapters can be used in conjunction with the native 0.8 mm and 1 mm coaxial adapters for the MA25400A to cover lower waveguide band measurements.
- Second, the Anritsu 3744A-EE or 3744A-EW mmWave module can be used. These version modules operate in the extended E and W waveguide bands and are operational using the MS4644B or MS4647B VectorStar (with Options 8x and 7) and the 3739C broadband/mmWave test set.
- The third configuration option is to use external mmWave modules with any model VectorStar (with Options 8x and 7) and the 3739C test set. For millimeter bands the VDI modules may be used.

Typical uncertainty curves and residual values are below for the first case where WR5 adapters are used on the MA25400A modules. These results were obtained using an SSLT calibration with an OML WR05 calibration kit. Other calibration kits with similar dimensional tolerances can perform similarly. Standard waveguide screw torque levels (6 cN-m) were used.

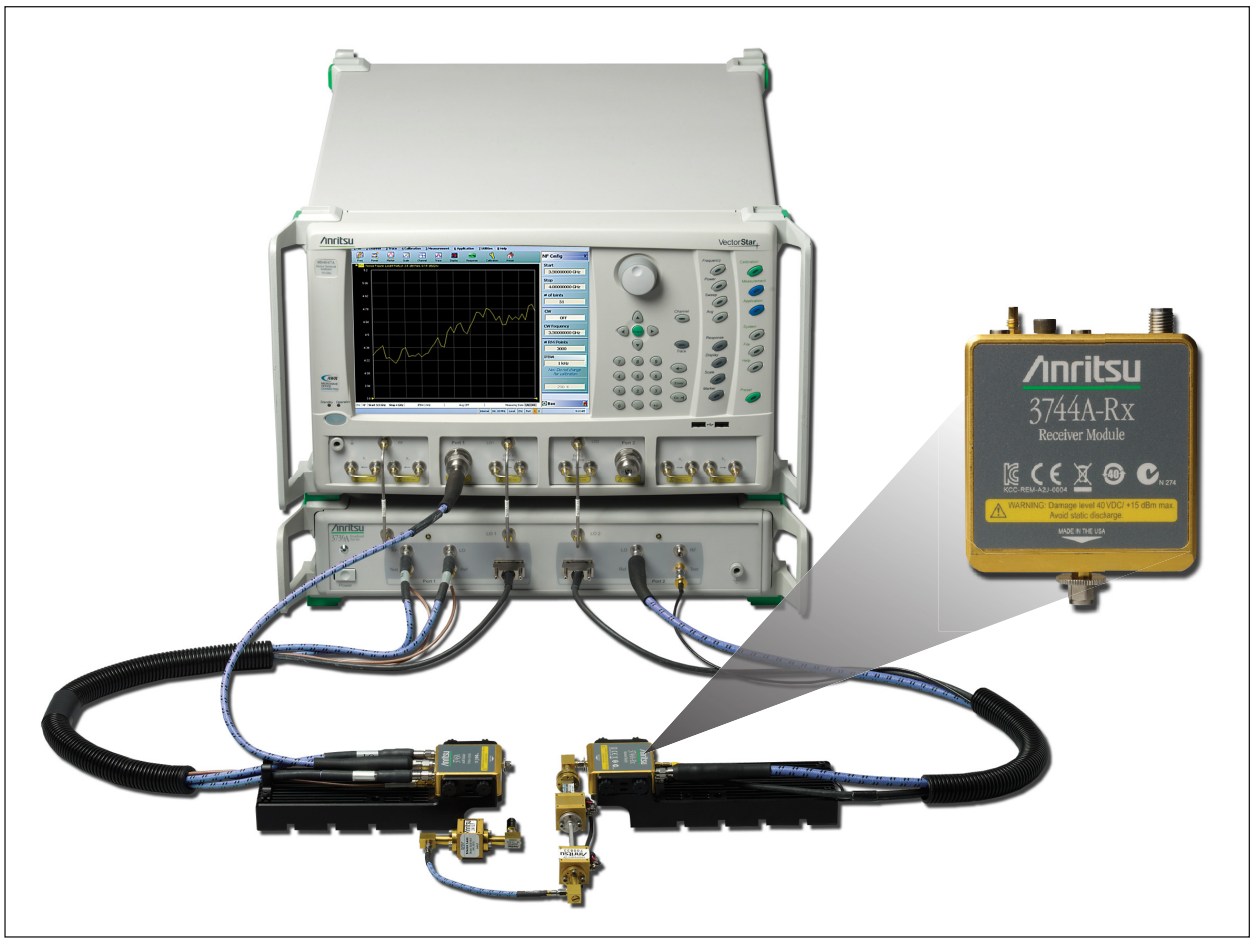
ME7838G4 with Option 41/48 and 3744A-Rx mmWave Noise Figure Measurements



ME7838G4 with 3744A-Rx Receiver Module

The 3744A-Rx receiver module can be used with Option 41, Noise Figure, and the ME7838G4 mmWave or broadband system to perform mmWave noise figure measurements from 30 GHz to 125 GHz. The receiver bypasses the internal couplers (see block diagram), maximizing the noise figure of the receiver for optimum noise figure measurement accuracy. The receiver is derived from the 3743AX mmWave module and utilizes the same nonlinear transmission line technology for optimum mmWave performance. Using the advantages of the 3743AX mmWave module system architecture provides a unique solution to mmWave noise figure measurements previously unavailable. Receiver modules with different bandwidth ranges are available. Consult the factory for more information.

With Option 48, differential (and common-mode) noise figure measurements are possible in the same wide frequency ranges. In this case, two 3744A-Rx modules (along with needed pre-amplifiers/filters) are used to complete the differential receiver. The Rx modules are typically connected as ports 2 and 4 to act as the differential/common-mode noise receiver when used with the ME7838G4.

Block Diagram – 3744A Receiver Module

The 3744A-Rx receiver module is optimized as a receiver-only mmWave module for applications such as mmWave antenna measurements and mmWave noise figure measurements. Elimination of the input coupler produces a mmWave receiver with excellent noise floor sensitivity and dynamic range. When coupled with a composite receiver, the receiver module provides a solution for mmWave noise figure measurements.

As with all cold source method noise figure measurements, the output of the DUT is first sent to an external composite receiver for pre-amplification. This ensures that the system noise figure is minimized for optimum measurement accuracy. The Anritsu Noise Figure Uncertainty Calculator (available on the website at www.anritsu.com) can be used to determine optimum preamplifier gain needed for the desired measurement uncertainty.

VDI Module Performance with VectorStar

Performance:	Directivity values are valid when using appropriate VDI calibration kits. All extender heads include a precision Test Port. The performance values here are typical and subject to change. Extended and other frequency ranges may be available.
Stability:	Measured for 1 hour after a 1 hour system warm-up, in a stable environment with ideal cables.
Dynamic Range:	The dynamic range (RBW 10 Hz) is measured by first connecting two TxRx heads together and normalizing the un-calibrated S21 and S12. The heads are then disconnected and terminated with a waveguide short. The rms of the measured S21 & S12 give the system dynamic range.
Test Port Power:	Test Port Power is typical. Reduced power is possible at band edges.

VDI Module Head Configurations

TxRx	Transmitter with two receivers (reference and measurement), and two couplers. Two TxRx heads are required for full two-port measurements.
TxRef	Transmitter with reference receiver and one coupler.
Rx	Measurement receiver.
Tx	Transmitter.

VDI Module Options

Micrometer-Drive Variable Attenuator	A 0 dB to 30 dB micrometer-drive variable attenuator option is available on TxRx and Tx modules up through WR1.5. If ordered, "–Attn" is added as an option suffix to the module model number. The attenuators reduce TPP and DR by as much as 8 dB in the WR3.4 and higher frequency bands and add approximately 2 in to the enclosure.
Increased Test Port Power	Options exist for increasing test port power in some full bands or in partial bands. Consult factory for more information.
Non-Standard Frequency Bands	Non-standard frequency bands or other specific needs are possible. Consult factory for more information.
Custom Configuration	Anritsu/VDI will work with customers to reconfigure any extender to meet specific needs.

Calibration and Correction Capabilities

Calibration Methods	Short-Open-Load-Through (SOLT) with Fixed or Sliding Load and supporting .s1p-defined cal kits Offset-Short-Offset-Short-Load-Through (SSLT) with Fixed or Sliding Load Triple-Offset-Short-Through (SSST) and overdetermined offset short (mSSST) Short-Open-Load-Reciprocal (SOLR) or Unknown Through Method (SSLR, SSSR) Line-Reflect-Line (LRL) / Line-Reflect-Match (LRM) – (up to 5 bands supported for multi-line configurations) Thru-Reflect-Line (TRL) - (up to 5 bands supported) Advanced-LRM (A-LRM™) for improved on-wafer calibrations Multiline TRL (mTRL) Hybrid Cals (allows combination of sub-cals of different type or media) AutoCal™ Thru Update available Secondary match correction available for improved low insertion loss measurements
Correction Models	2-Port (Forward, Reverse, or both directions) 1-Port (S_{11}, S_{22}, or both) Transmission Frequency Response (Forward, Reverse, or both directions) Reflection Frequency Response (S_{11}, S_{22}, or both)
Merged Calibration	Merge multiple calibration methods over bands of frequency points. Note that merge does not need to be used for broadband coaxial (SOLT/R-SSST/R) 1 mm or 0.8 mm calibrations using Anritsu calibration kits. These can be done as one unified calibration.
Coefficients for Calibration Standards	Use the Anritsu calibration kit USB Memory Device to load kit coefficients and characterization files. Enter manual coefficients into user-defined locations. Use complex load models.
Reference Impedance	Modify the reference impedance from 50 Ω to any impedance greater than 0 Ω.
Interpolation	Allows interpolation between calibration frequency points. Accuracy will be reduced at non-calibration frequencies and that degradation is dependent on the frequency step size in the initial calibration and the electrical length of the user's setup.
Adapter Removal Calibration	Characterizes and "removes" an adapter that is used during calibration that will not be used for subsequent device measurements; for accurate measurement of non-insertable devices.
Dispersion Compensation	Selectable as Coaxial, other non-dispersive (e.g., for coplanar waveguide), Waveguide, or Microstrip.
Power	
Power Meter Correction	Different power meter calibrations are available to enhance power accuracy at the desired reference plane. The source power will match the target calibration power, as read by the power meter, to within ~0.1 dB for short periods of time (determined by thermal drift of the system and the power meter). The absolute accuracy of the calibrated power will be dependent on the power meter and sensor used.
Flat Power Calibrations	A flat power calibration (when in frequency sweep mode) is available at a user-selectable power level, if it is within the power adjustment range of the internal source. The flat power correction is applied to other power levels directly as an offset. Multiple power meters/sensors may be needed depending on the frequency range. An adapter may be required to the 1mm module test port.
Linear Power Calibrations	A linear power calibration is performed over a range of power levels for use in power sweep mode and is performed at a specified frequency or frequency range (for multifrequency gain compression).
External Power Meter	Both calibrations are performed using an external power meter (Anritsu ML243xA, ML248xB, ML249xA, Agilent 437B (or equivalent), Keysight N191XA/EPM Series, Rhode and Schwarz NRP2 meter with a broadband 110 GHz sensor, or Elva DPM power meter) over the Dedicated GPIB port, or a USB power sensor (Anritsu MA24106A, MA24108A, MA24118A, MA24126A, MA24208A, MA24218A, MA24330A, MA24340A, MA24350A, MA24507A, or MA24510A, or Erickson PM5x meter) connected to a USB port. Note: Usage of the MA24500A series sensor requires a dual USB Type A male to single USB Type A female cable to supply needed current draw. Because of certain bandwidth requirements, the MA24500A series can only be used for power calibrations above nominally -35 dBm on VectorStar. Accuracy with the MA24500A series of sensors (when used with VectorStar) may be degraded below 1 MHz.
Embedding/De-embedding	The MS4640B is equipped with an Embedding/De-embedding system.
De-embedding	De-embedding is generally used for removal of test fixture contributions, modeled networks and other networks described by S-parameters (s2p files) from measurements.
Embedding	Similarly, the Embedding function can be used to simulate matching circuits for optimizing amplifier designs or simply adding effects of a known structure to a measurement.
Multiple Networks	Multiple networks can be embedded/de-embedded and changing the port and network orientations is handled easily.
Extraction Utility	An extraction utility is part of this package that allows the easier computation of de-embedding files based on some additional calibration steps and measurements.
Impedance Conversion	Allows entry of different impedances (complex values) for different ports.

Information on Using MA25400A-specific Adapters

The flange-based RF coaxial interface is a unique test port that enables simple direct connection to broadband RF probes. There are times when it is desirable to adapt to other media and the adapters listed below can help.

To do direct 1 mm coaxial S-parameter measurements: use the 33WG50 adapters. Additional 1 mm adapters are in the 3656 series calibration kit. Two of the 33WG50 adapters are included in the ME7838G4 system accessory kit.

To do direct 0.8 mm coaxial S-parameter measurements and verifications: use the 33.8G50 adapters. Additional 0.8 mm adapters are in the 3659 calibration kit.

To do direct WR-5 waveguide S-parameter measurements and assurance tests: use the 35WR5G adapters.

To do simple, direct broadband measurements in the native interface: use the 33GG50 thru. One of these thrus is included in the ME7838G4 system accessory kit.

To do power calibrations: At a minimum, the 33WG50 and 35WR5G adapters are needed to cover the full frequency range of the instrument (using 3-4 power meters). The 35WR6GB adapter bundle can be used for additional calibration flexibility for frequency ranges including parts/all of the 110-170 GHz range. The 35WR6GB adapter bundle can be used for additional calibration flexibility for frequency ranges including parts/all of the 110-170 GHz range. Power calibrations over subsets of the range may only need one adapter depending on the frequencies involved. Adapter loss can be de-embedded using the power calibration embedding/de-embedding tools and generic adapter .s2p files provided by Anritsu (or the individual adapters can be user-characterized directly for even greater accuracy). Please refer to the VectorStar Calibration and Measurement Guide (P/N: 10410-00318) for more information.
